

ISM 672 — Assignment 2

Writing Valid Data — Submission Write-Up

DjangoTraders — djtraders app

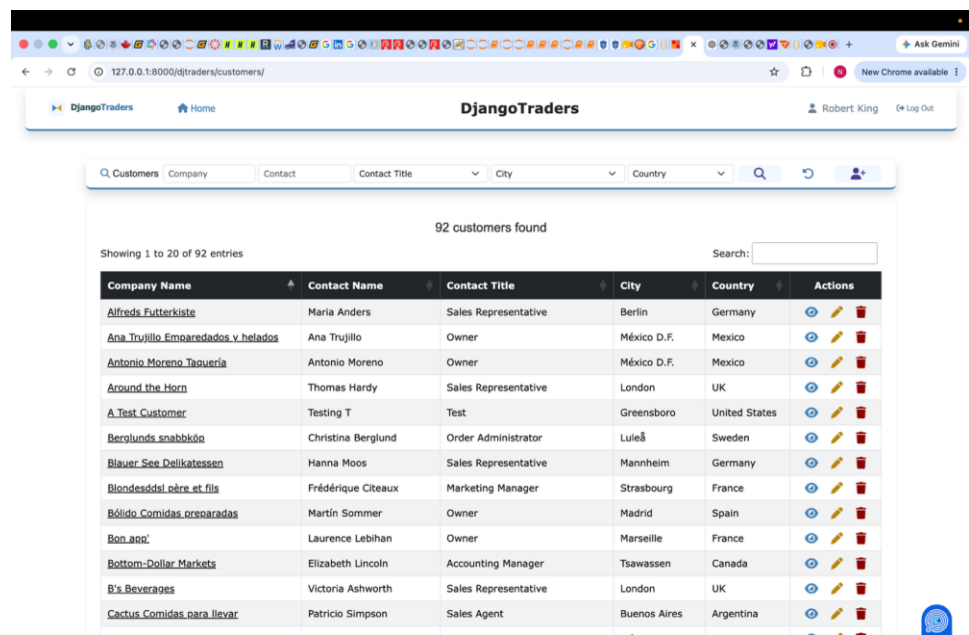

Fall 2026

Requirement 1

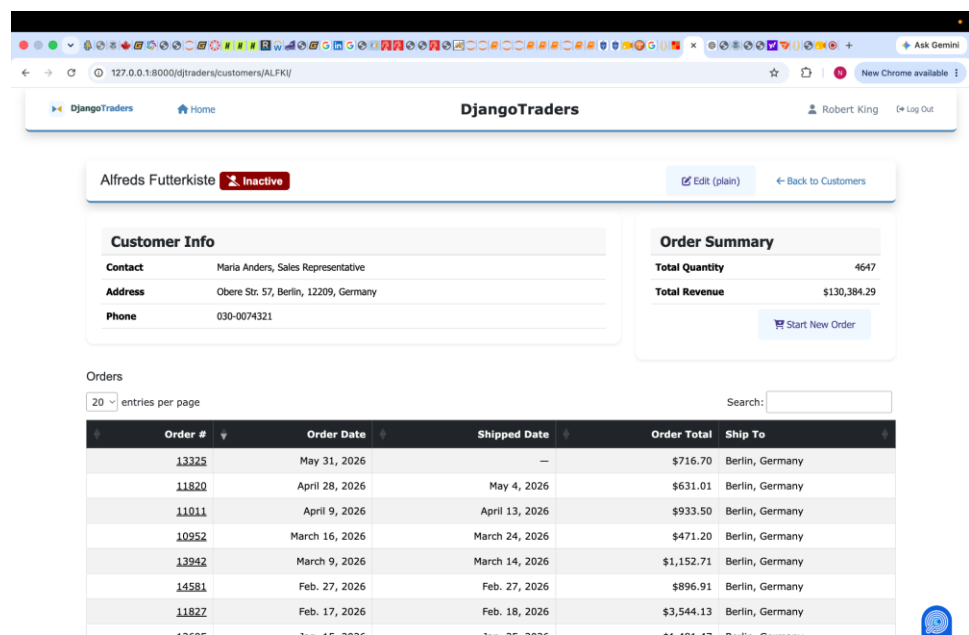

Customer deletion in this project is a soft delete: it sets Customer.inactive_date to today's date rather than removing the row, so the customer's record and order history remain intact and the action is reversible. This requirement adds the missing reverse action.

Feature: Reactivate a customer. An employee can reactivate an inactive customer directly from the customer list or the customer's edit page. The Reactivate control only appears for customers who are currently inactive the same condition that drives the existing "Inactive" badge. Clicking it shows an in-page confirmation (not a browser pop-up) and submits a real POST form with a CSRF token, mirroring the Delete action's own convention exactly. The view clears inactive_date and nothing else, so order history is never touched.

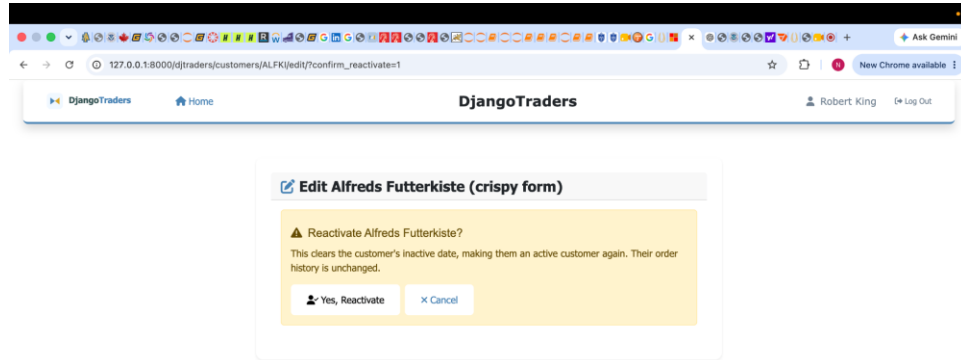

Access control: Reactivate is employee-only, using the identical session check already used to gate Delete and Edit,a customer or an anonymous visitor cannot reach this action, and the view itself enforces that even if someone bypasses the hidden button.

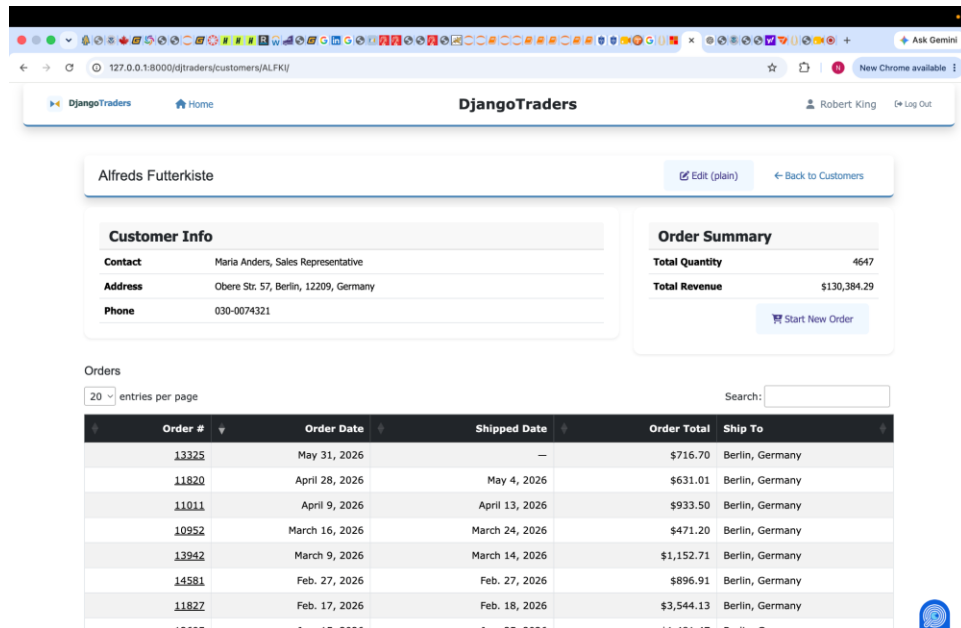

The customer list, logged in as an employee, before any action.

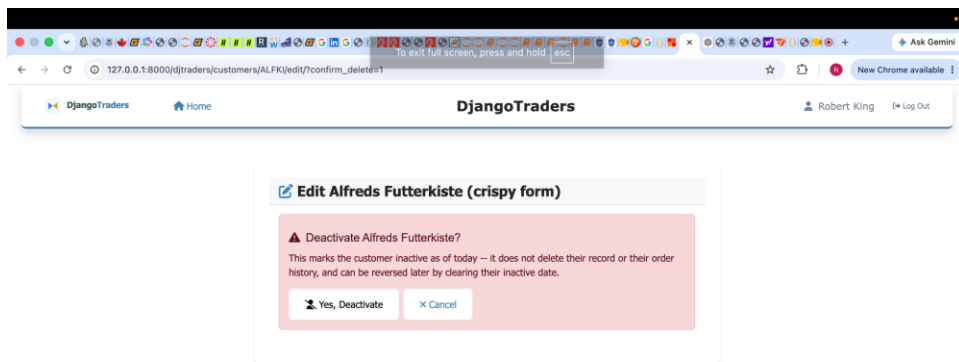

A customer marked Inactive, showing the badge on their detail page.

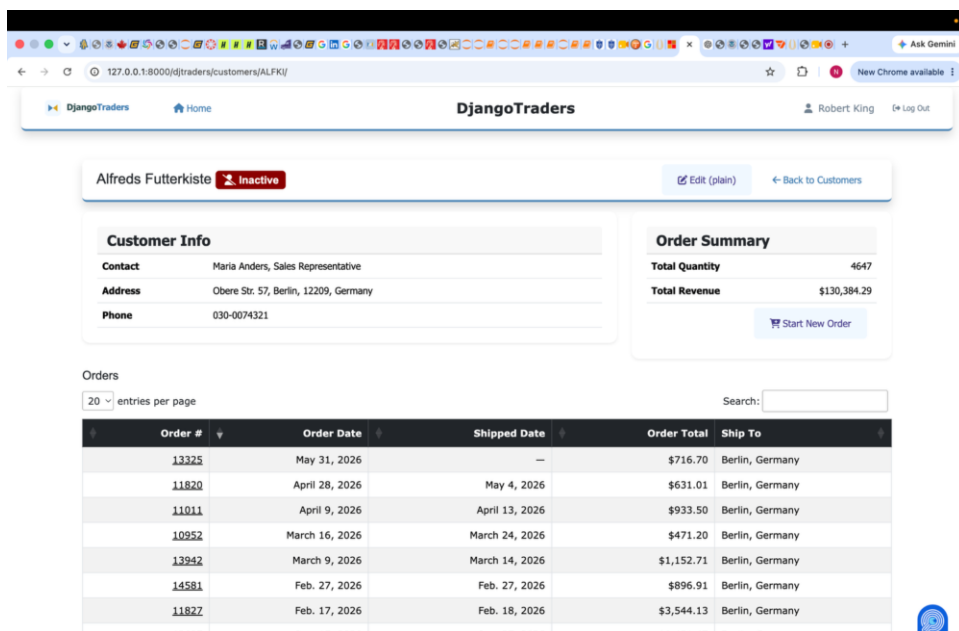

The Reactivate control appears only for this inactive customer.

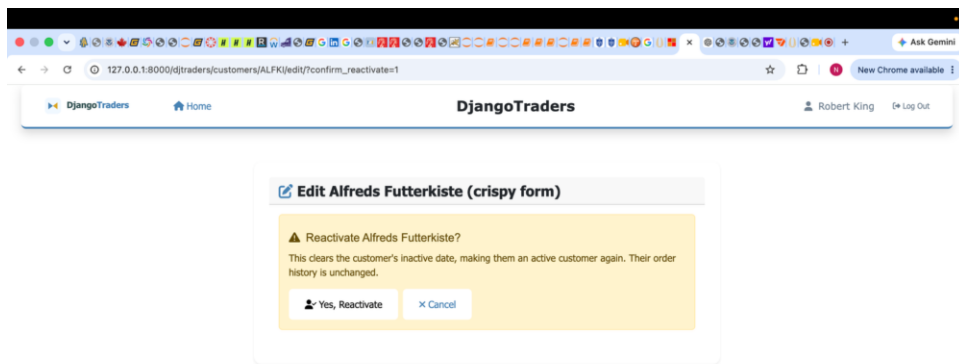

The in-page confirmation prompt before reactivating — no browser pop-up.

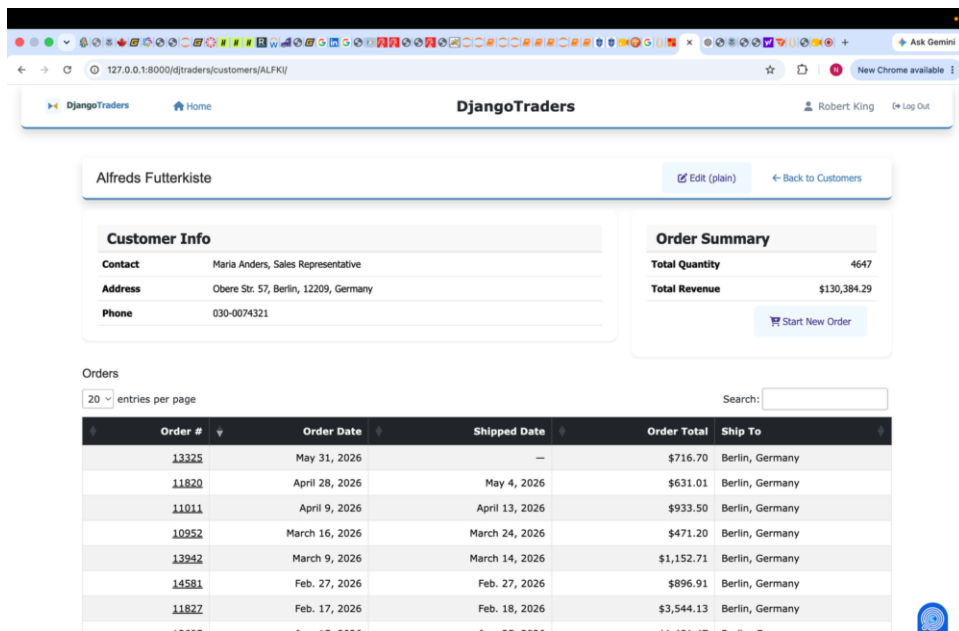

After confirming: the customer is active again and the Inactive badge is gone.

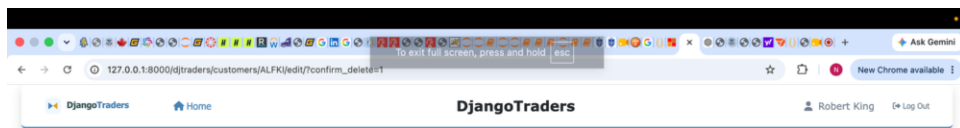

Order history for the customer is unchanged after reactivation.

Attempting the reactivate action as a non-employee session is blocked/redirected.

The customer list after reactivation, with the Delete icon restored in place of Reactivate.

[Edit Alfreds Futterkiste \(crispy form\)](#)

⚠ Deactivate Alfreds Futterkiste?

This marks the customer inactive as of today -- it does not delete their record or their order history, and can be reversed later by clearing their inactive date.

☒ Yes, Deactivate ☐ Cancel

Confirming the reactivated customer's record in the database remains intact.

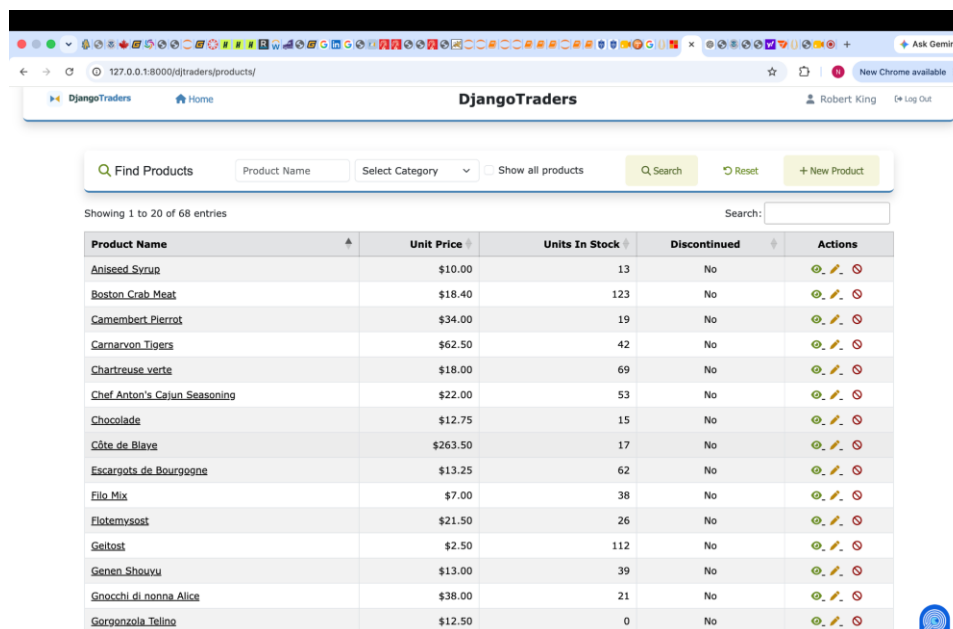

Requirement 2

Customer CRUD (create, edit, soft delete) was fully provided; Product's equivalent was built from scratch, mirroring that same pattern: an unsaved-instance "create empty and edit" design, a ModelForm rendered with django-crispy-forms, the project's existing access-check helpers, and the same entity-aliased styling already used for Customer and Supplier pages.

Create, Edit, Discontinue. A new Product is built as a blank, unsaved instance and written to the database only once Save is clicked, the same object-first design Customer Create already uses, nothing is left half-written if the page is abandoned mid-edit. Edit reuses the same form for an existing Product. Discontinue is a soft delete: it sets Product.discontinued (not a hard row deletion), after an in-page confirmation prompt, the same convention Customer Delete uses. A discontinued product is excluded from the active product catalog (the default product list view) and from the Add to Cart dropdown on the shopping cart page, so it can no longer be ordered.

Access control: Product Create, Edit, and Discontinue are employee-only, enforced in the view itself (not just by hiding the button) the same reasoning as Customer's own employee-only create/delete actions: a Product is a catalog-wide resource, not something any individual customer has a self-service claim over.

Validation rule chosen: Unit price cannot be negative. Nothing in the database schema (Product.unit_price is a plain, unconstrained FloatField) prevents a negative price from being stored, this rule exists purely in application code. It is layered the same way the provided Customer code demonstrates on phone and company_name: an HTML5 min="0" attribute gives an immediate browser-side courtesy warning, and a server-side clean_unit_price() method on ProductEditForm is the real, unbypassable gate. Both layers were tested by submitting a negative price normally (rejected by the browser) and again after removing the min attribute in DevTools (rejected by the server with a visible error message).

Product Name	Unit Price	Units In Stock	Discontinued	Actions
Aniseed Syrup	\$10.00	13	No

Product detail page reflecting the edited fields correctly.

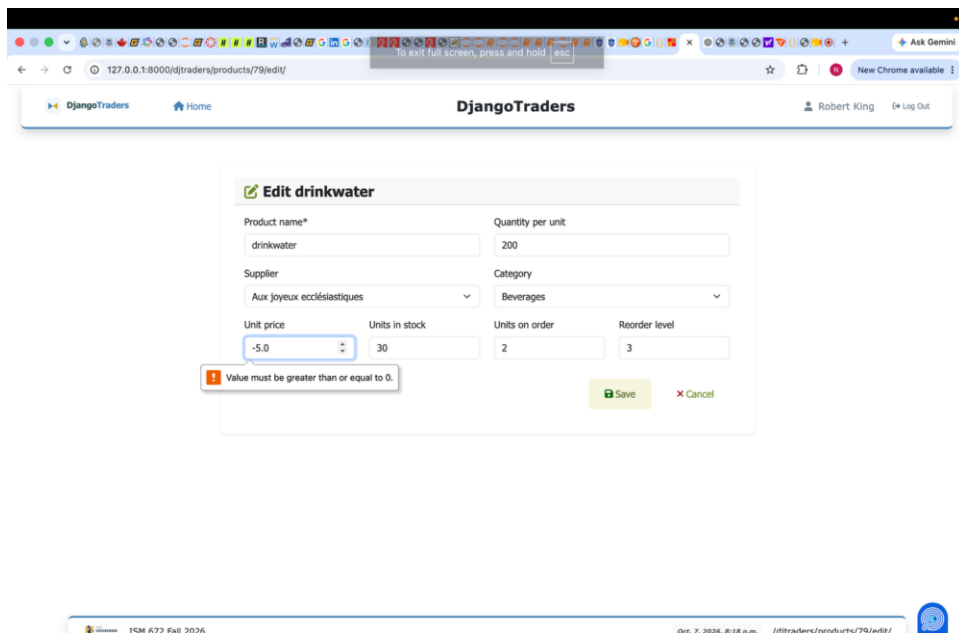

Create form validation: a blank required field being rejected.

Final confirmed state of the product catalog after all CRUD operations.

Additional view of the edit form in its crispy-forms rendering.

Additional view confirming access control for a logged-out visitor.

Database-level confirmation (pgAdmin) that discontinued is set, not the row deleted.

Requirement 3

All seven enhancements below were completed. Each is independent of the others and was built and tested separately, extending the provided cart/order flow (order_create, order_build, order_add_line, order_commit, _cart_lines) rather than replacing it.

Summary of completion: Completed — Enhancement 1 (Remove a line), Enhancement 2 (Category filter), Enhancement 3 (Discount), Enhancement 4 (Clear Cart), Enhancement 5 (Stock validation and enforcement), Enhancement 6 (Ship-to form), Enhancement 7 (Employee-initiated orders). None were partially attempted or skipped.

Enhancement 1

Each cart line has its own Remove control, added as a column on _order_line_row.html and wired up via AJAX (RemoveOrderLineItem in DjangoTraders.js), which POSTs to a new order_remove_line view and deletes that key from request.session["cart"]["lines"] directly, there is no database row to delete before commit. The row disappears without a page reload, the running total recalculates immediately, and removing the last line restores the "Your cart is empty" placeholder row.

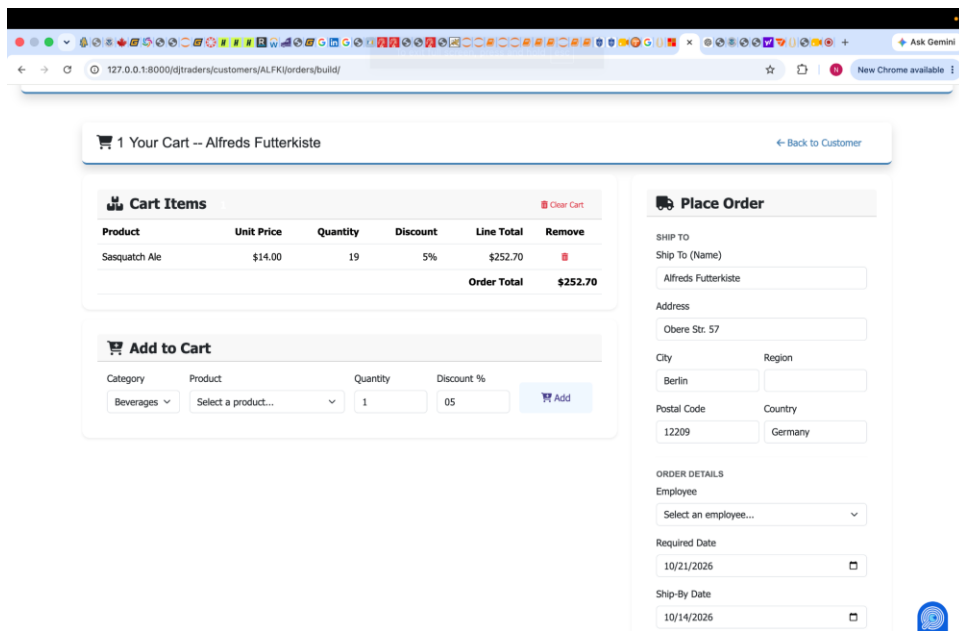

The screenshot shows the DjangoTraders web application interface. At the top, the browser address bar shows the URL `127.0.0.1:8000/djtraders/customers/ALFK/orders/build/`. The application header includes the DjangoTraders logo, a Home link, and user information for Alfreds Futterkiste with a Log Out link.

The main content area is titled "1 Your Cart -- Alfreds Futterkiste" with a "Back to Customer" link. It is divided into three sections:

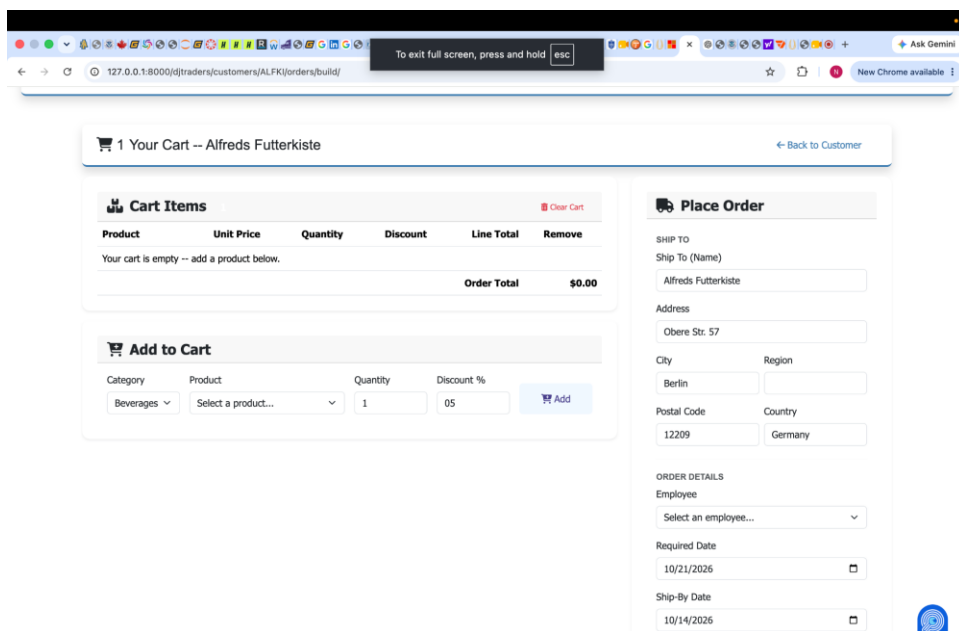

- Cart Items:** A table listing items in the cart. It has columns for Product, Unit Price, Quantity, Discount, Line Total, and a Remove button (represented by a red square icon).
- Add to Cart:** A form for adding new items, including fields for Category, Product, Quantity, and Discount %.
- Place Order:** A form for placing the order, including fields for Ship To (Name), Address, City, Region, Postal Code, Country, Employee, Required Date, and Ship-By Date.

Product	Unit Price	Quantity	Discount	Line Total	Remove
Aniseed Syrup	\$10.00	10	10%	\$90.00	
Sasquatch Ale	\$14.00	19	5%	\$252.70	
Order Total				\$342.70	

Cart with two line items, before removing one.

After clicking Remove: the line is gone and the Order Total updated, no page reload.

Removing the last remaining line restores the empty-cart message.

Enhancement 2

A Category filter dropdown sits above the Product selector on the Add to Cart form. Selecting a category narrows the Product dropdown to only that category's items, implemented client-side (FilterProductOptions in DjangoTraders.js) by rebuilding the option list from each option's own data-category-id attribute, which ProductSelectWidget attaches server-side. Discontinued products are excluded from the dropdown in every case, since OrderDetailForm's own queryset already filters them out regardless of what the category filter shows.

Confirming a discontinued product never appears, regardless of category chosen.

Enhancement 3

A Discount % field was added to the Add to Cart form. Up to 10% is accepted for an ordinary customer session; discounts above 10% are refused server-side by OrderDetailForm.clean_discount_percent() unless the cart is being operated by a logged-in employee (allow_high_discount), tying this enhancement directly to Enhancement 7's employee-initiated order flow as the approval mechanism. The entered percentage is converted to the fraction OrderDetail.discount actually stores, applied to the line total, and persisted at commit.

 Ship-By Date
 10/14/2026

A second before-state, cart populated across multiple products.

The screenshot shows the DjangoTraders web application. The top navigation bar includes the site name 'DjangoTraders', a 'Home' link, and a user profile for 'Alfreds Futterkiste' with a 'Log Out' link. The main content area is titled 'Your Cart -- Alfreds Futterkiste' and includes a 'Back to Customer' link. Below this, there are two main sections: 'Cart Items' and 'Place Order'.

The 'Cart Items' section displays a table with columns: Product, Unit Price, Quantity, Discount, Line Total, and Remove. The table is currently empty, with a message stating 'Your cart is empty -- add a product below.' Below the table, there is an 'Add to Cart' section with a form for adding products. The form includes a 'Category' dropdown (set to 'All Catego...'), a 'Product' dropdown (set to 'Select a product...'), a 'Quantity' input field (set to '0'), and a 'Discount %' input field (set to '0'). An 'Add' button is visible.

The 'Place Order' section contains a 'SHIP TO' form with fields for 'Ship To (Name)' (set to 'Alfreds Futterkiste'), 'Address' (set to 'Obere Str. 57'), 'City' (set to 'Berlin'), 'Region' (set to 'Berlin'), 'Postal Code' (set to '12209'), and 'Country' (set to 'Germany'). Below this, there is an 'ORDER DETAILS' section with a dropdown for 'Employee' (set to 'Select an employee...'), a 'Required Date' input field (set to '10/21/2026'), and a 'Ship-By Date' input field.

The corresponding after-state confirming every line was cleared at once.

Enhancement 5

Stock is checked at two separate points. When a line is added: a browser-side courtesy warning reads each product option's data-stock attribute and blocks an obviously too-large quantity before the request is sent, and `OrderDetailForm.clean()` performs the real, server-side cross-field check (product and quantity together) and refuses the line if quantity exceeds `units_in_stock`. At commit: `order_commit` re-checks every line's current stock (it may have changed since the line was added) and refuses the whole commit if any line now exceeds it, rather than silently shipping a partial order; on success, every line's product stock is decremented atomically, inside the same transaction as the `Order/OrderDetail` writes, using a database-side `F()` expression rather than a Python read-then-subtract.

The screenshot shows the DjangoTraders web application. The top navigation bar is the same as the previous screenshot. The main content area is titled 'Your Cart -- Alfreds Futterkiste' and includes a 'Back to Customer' link. Below this, there are two main sections: 'Cart Items' and 'Place Order'.

The 'Cart Items' section displays a table with columns: Product, Unit Price, Quantity, Discount, Line Total, and Remove. The table is currently empty, with a message stating 'Your cart is empty -- add a product below.' Below the table, there is an 'Add to Cart' section with a form for adding products. The form includes a 'Category' dropdown (set to 'Beverages'), a 'Product' dropdown (set to 'Côte de Blaye (\$263.50)'), a 'Quantity' input field (set to '100'), and a 'Discount %' input field (set to '05'). An 'Add' button is visible. Below the form, there is a red warning message: 'Only 17 in stock -- reduce the quantity.'

The 'Place Order' section contains a 'SHIP TO' form with fields for 'Ship To (Name)' (set to 'Alfreds Futterkiste'), 'Address' (set to 'Obere Str. 57'), 'City' (set to 'Berlin'), 'Region' (set to 'Berlin'), 'Postal Code' (set to '12209'), and 'Country' (set to 'Germany'). Below this, there is an 'ORDER DETAILS' section with a dropdown for 'Employee' (set to 'Select an employee...'), a 'Required Date' input field (set to '10/21/2026'), and a 'Ship-By Date' input field.

Adding a quantity above current stock — the browser-side warning blocks it before submission.

Confirming the product's updated units_in_stock value after a successful commit.

Enhancement 6

The cart page's previously read-only "Shipping To" display is now a real, validated ShipToForm, pre-filled from the customer's current on-file address but fully editable. Ship-to name and country are required fields; submitting with a blank name is rejected before commit. The form's own cleaned data not the customer's raw Customer record is what order_commit writes onto the resulting Order's ship_* columns, confirmed by editing the address to something different from the customer's on-file record and verifying the placed order reflects the edited value.

Order #	Order Date	Shipped Date	Order Total	Ship To
15349	Oct. 7, 2026	Oct. 14, 2026	\$66.50	orlu, Germany
15348	Oct. 7, 2026	Oct. 14, 2026	\$3,754.88	Berlin, Germany
13325	May 31, 2026	—	\$716.70	Berlin, Germany
11820	April 28, 2026	May 4, 2026	\$631.01	Berlin, Germany
11011	April 9, 2026	April 13, 2026	\$933.50	Berlin, Germany
10952	March 16, 2026	March 24, 2026	\$471.20	Berlin, Germany
13942	March 9, 2026	March 14, 2026	\$1,152.71	Berlin, Germany

Ship-to fields pre-filled with the customer's on-file address, editable.

The screenshot shows a PostgreSQL database interface with a query window displaying the following SQL:

```

1 SELECT order_id, order_date, shipped_date, freight
2 FROM orders
3 WHERE customer_id = 'ALFKI'
4 ORDER BY order_date DESC;

```

The Data Output pane shows the results of the query, displaying columns: order_id, order_date, shipped_date, and freight. The results are sorted by order_date in descending order.

order_id	order_date	shipped_date	freight

Database confirmation that the order's ship_* columns match the submitted form, not Customer.address.

A second validation example: a blank required country field rejected.

Enhancement 7

A logged-in employee can now start and build a cart on behalf of any customer, reusing the exact same views, forms, and templates a customer uses for their own cart. Access is governed by a new `_cart_access_denied()` helper, mirroring the relaxed-access pattern Customer Edit already uses: either the cart's own logged-in customer, or any logged-in employee, may operate it. A plain customer logged in as themselves is still blocked from reaching a different customer's cart, confirmed by attempting to navigate directly to another customer's cart URL.

An employee viewing a customer's detail page now sees the Start New Order option.

Confirming the customer's own cart remains inaccessible to any other customer session throughout.

Requirement 4 — CSS / UI-UX

Three improvements were made, all extending the project's existing `static/common/css/DjangoTraders.css` and `templates/common/base.html` rather than introducing a second stylesheet.

1. Cart item-count badge

A small red count badge sits on the cart icon in the top navbar whenever the logged-in customer has items in their cart, using the same badge pattern already used for the inactive-customer status badge. It updates live via JavaScript immediately after an add or remove, with no page reload required.

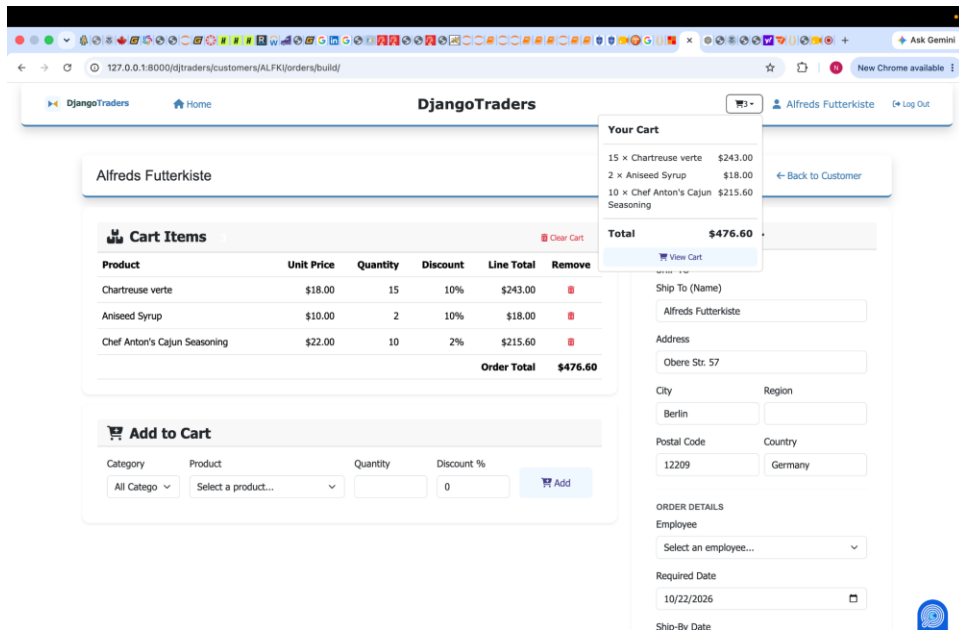

2. Success flash and toast notification on add

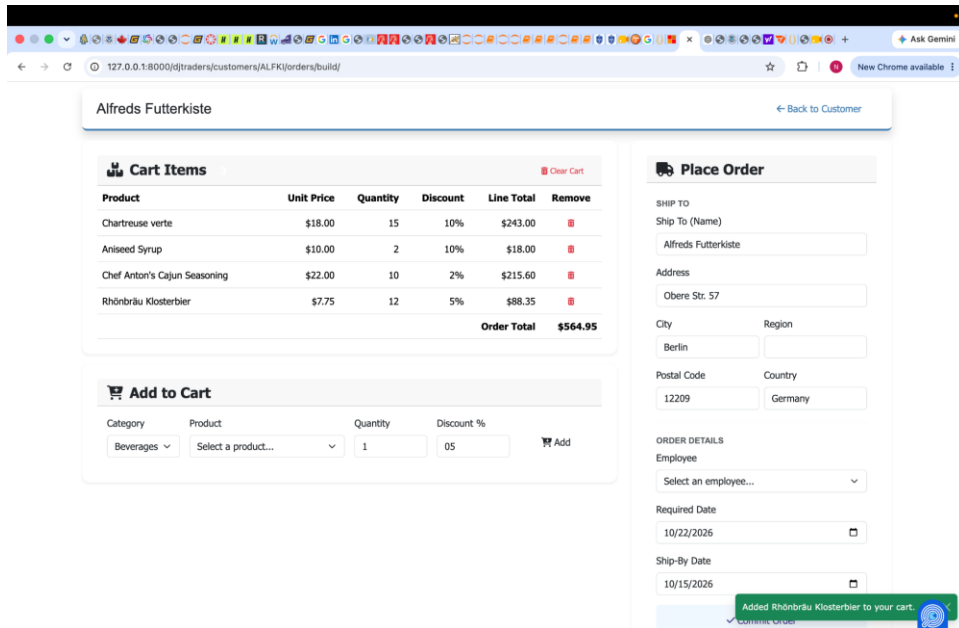

Adding a product to the cart now gives two forms of feedback: the newly added or updated row briefly flashes green before fading, and a Bootstrap toast notification pops in the bottom-right corner confirming what was added replacing the previous behavior where the row simply appeared with no acknowledgment.

3. Responsiveness pass on the cart page

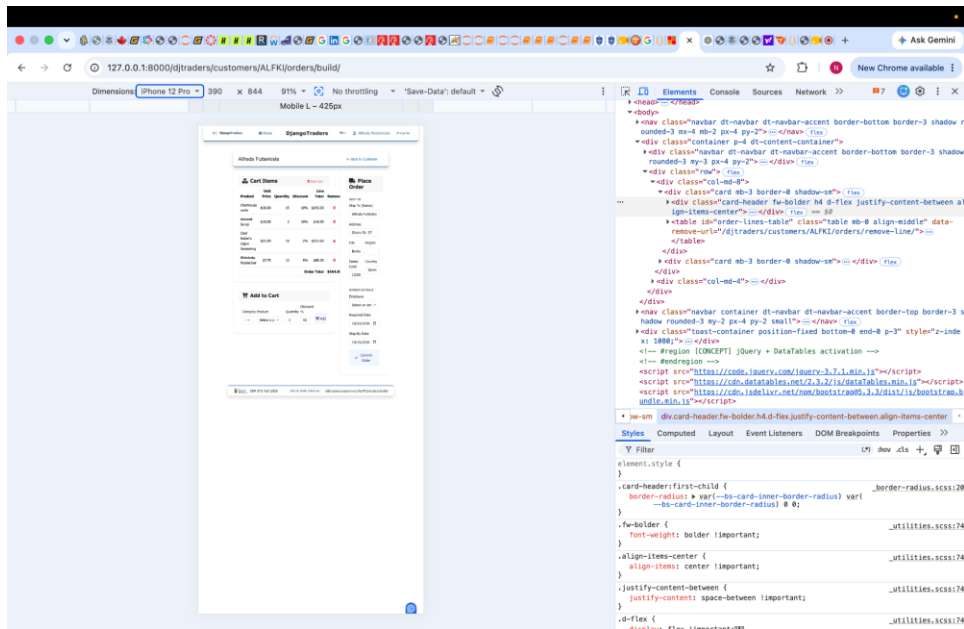

The Cart Items table, Add to Cart form, and Place Order card were checked at a narrow (mobile-width) browser width. The Add to Cart row's five fields were given extra vertical spacing at narrow widths so the stacked fields stay readable rather than crowding together.

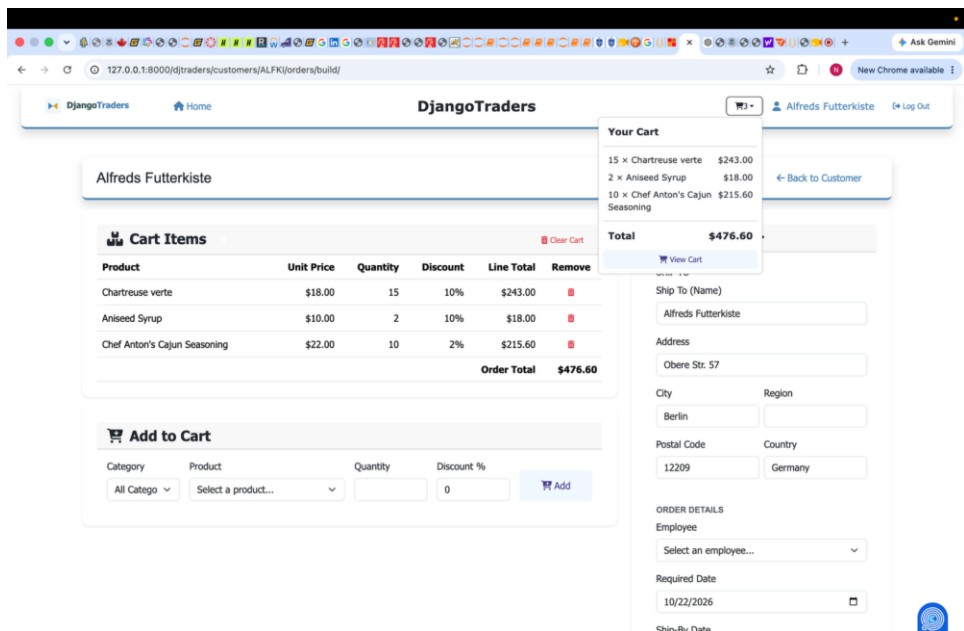

Full-width cart page with the item-count badge visible on the navbar cart icon.

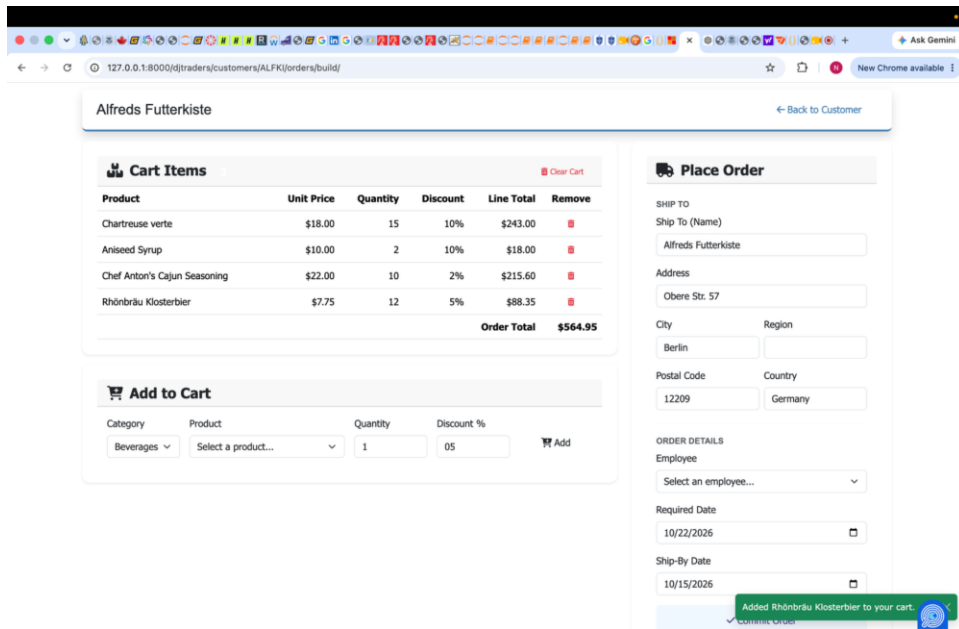

A product just added, showing the green highlight flash and the success toast notification.

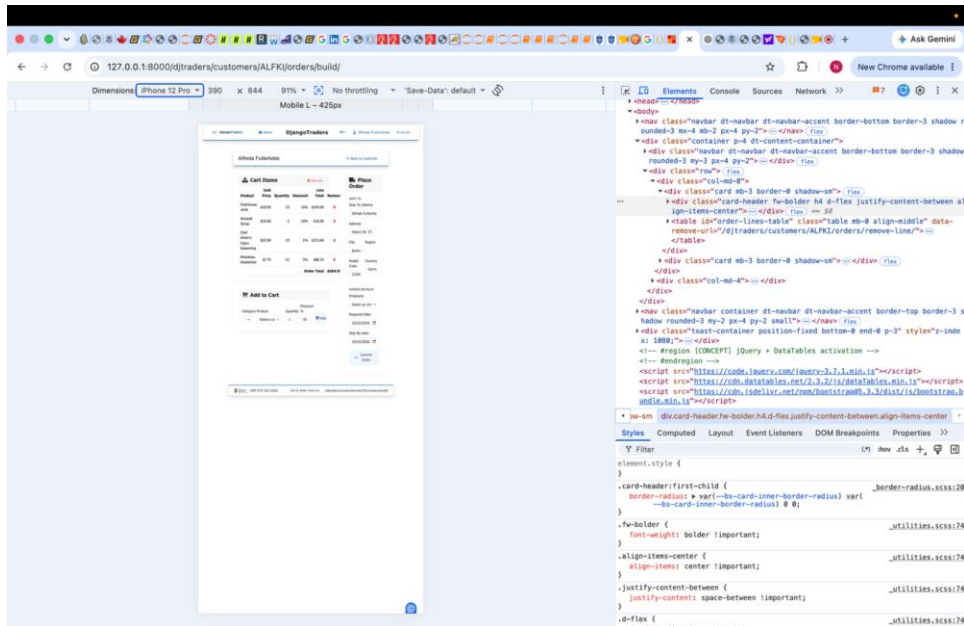

The same cart page at a narrow, mobile-width viewport, confirming it remains usable.

Second view of the navbar badge, updating live after a cart change.

Before-state of the narrow-width layout prior to the spacing fix.

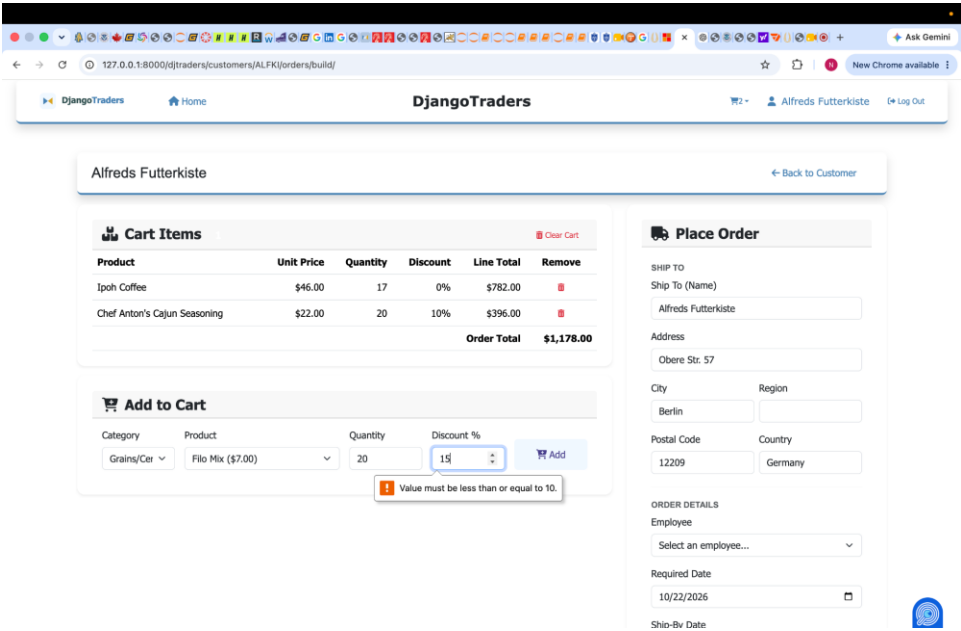

After-state confirming the Add to Cart row holds up on a narrow screen.

Extra Credit

Extra Credit A — Volume-Based Default Discount

Once a single cart line's quantity reaches 20 units, a 10% discount is applied automatically by OrderDetailForm.clean(), without the customer entering one. This is separate from Enhancement 3's customer-entered discount: if a manually entered discount is already higher than 10%, it is left unchanged rather than being reduced the larger of the two always wins. The 20-unit threshold was chosen as a round, demonstrable volume level distinct from the per-line discount cap in Enhancement 3.

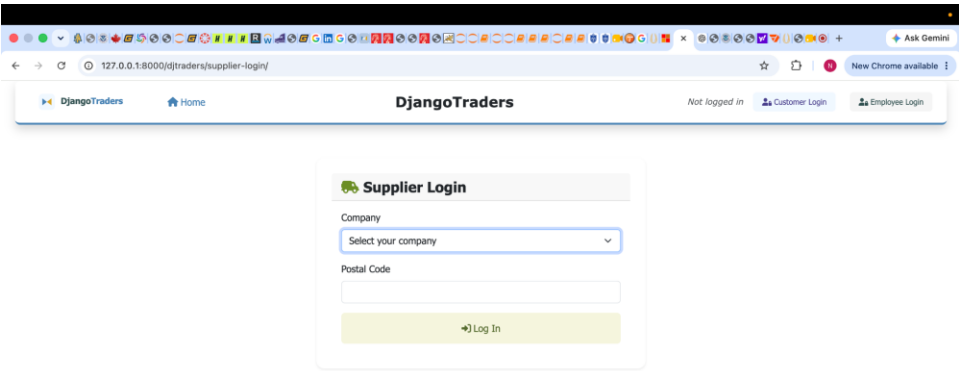

A quantity of 19 (just below the threshold) — no automatic discount applied.

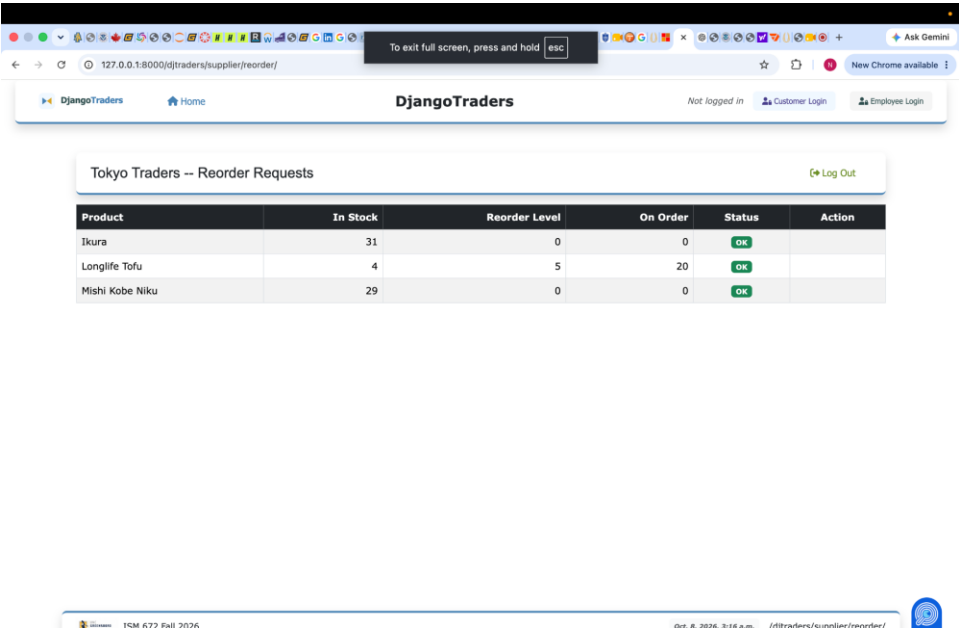

The same product at a quantity of 20 — the 10% volume discount is applied automatically, with a confirming toast.

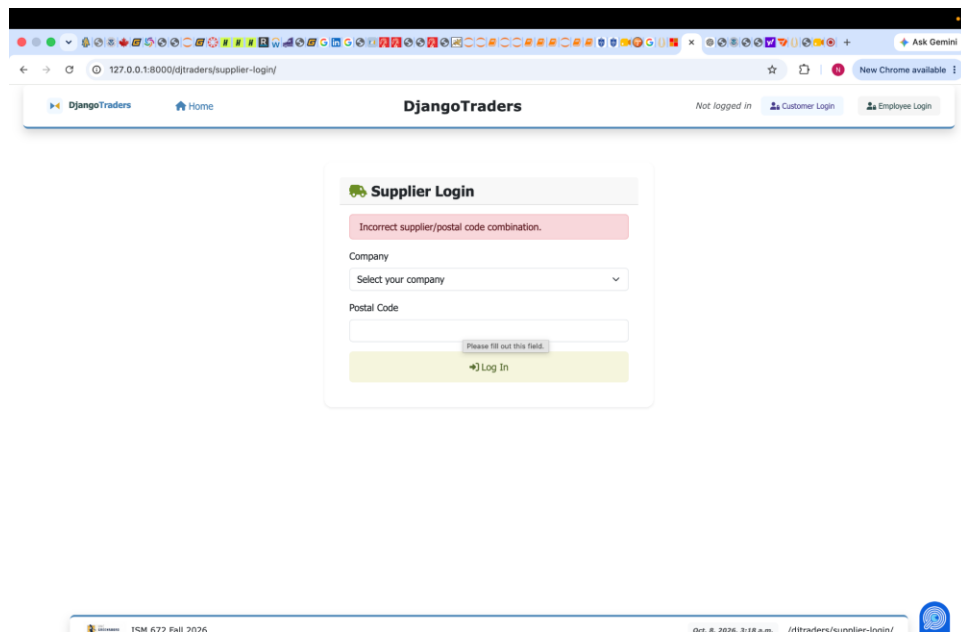

Extra Credit B — Supplier Login and Reorder Request

A supplier login mirrors the existing customer/employee login pattern: a supplier is selected by company name and authenticated against their postal code, since Supplier has no dedicated password column. A logged-in supplier reaches a self-service page listing only their own products, flagging a product as needing reorder when units_in_stock is at or below reorder_level and units_on_order does not already cover that gap —a product already covered by an incoming order is not flagged again. A "reorder unit" is defined as 50 units; clicking Request Reorder on a flagged product adds 50 to its units_on_order.

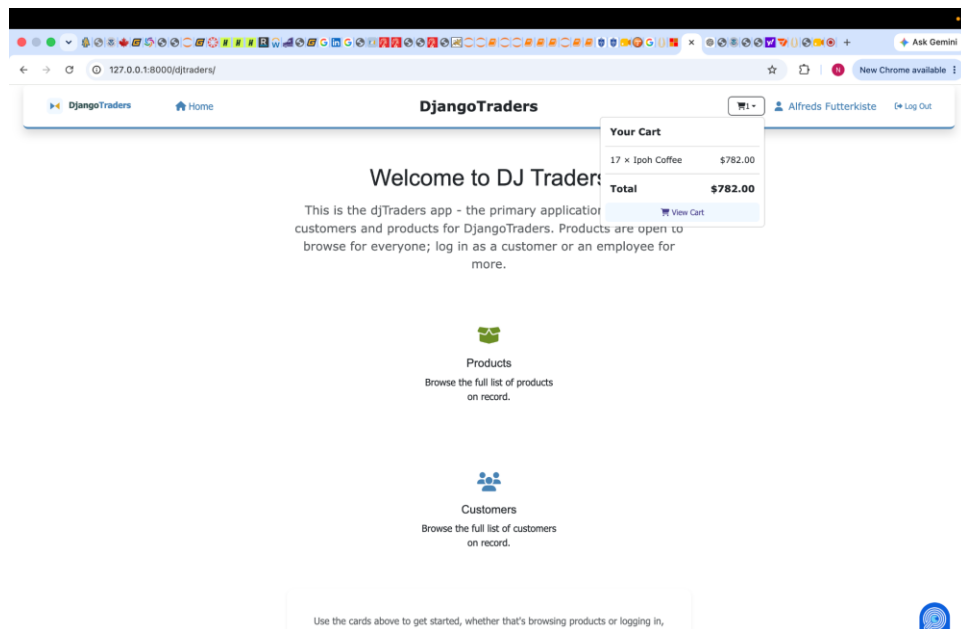

The reorder page for a logged-in supplier, showing a flagged product and a non-flagged product side by side.

Extra Credit C — Cart Visible on Every Page (+15%)

The logged-in customer's cart is shown as a dropdown in the top navbar on every page, not just the cart page itself — fed server-side by a new `cart_summary` context processor and kept live by JavaScript after any AJAX add or remove, with no page reload. The dropdown lists each line's quantity, product name, and price, a running total, and a View Cart link into the full cart page.

The cart dropdown open from the Home page.

The dropdown after an item is removed on the cart page, confirming the badge updated without a reload.

The empty-cart state of the dropdown.
